Profile

Master's student in Software Engineering at Politecnico di Torino, focused on distributed cloud infrastructure and the development of LLM-integrated systems. Currently looking for an internship with a master's thesis in cloud engineering, where I can also apply my experience with generative AI, starting from March 2027. Open to relocation.

Education

Politecnico di Torino — Turin, Italy
MSc in Software Engineering (Expected grade: 105/110) — *Sep 2025 – Present*

- Relevant coursework: system programming, software design and architecture;
  in progress: distributed systems, containerization and orchestration technologies, cybersecurity, "agile" methodologies

Politecnico di Torino — Turin, Italy
BSc in Computer Engineering (Final grade: 93/110) — *Oct 2022 – Sep 2025*

- Relevant coursework: algorithms and data structures, operating systems, object-oriented programming, databases

Technical Skills

Programming	:	Python, Rust, C, JavaScript/TypeScript, Java, C#, MIPS, RISC-V and ARM assembly
Frameworks	:	FastAPI, .NET, React, Node.js, Express, N8N
DevOps	:	Docker, Kubernetes, GitHub Actions, CI/CD Pipelines, Linux/Bash
Databases	:	Relational (SQLite, PostgreSQL, Microsoft SQL Server), NoSQL (MongoDB)
Languages	:	Italian (Native), English (C1)

Experience and Awards

AI Software Engineer Intern — Mar 2025 – Jul 2025
Assist S.P.A. — *Beinasco, Italy*

- Designed and developed an LLM-based customer support chatbot with related API tooling implemented in .NET, with estimated savings of over 150 person-hours per week for Assist's support team.
- Orchestrated GDPR-compliant agentic workflows on N8N, automating document review for an estimated 150–300 requests per week using low-cost OpenAI o3-mini models.

Finalist — Mar 2026 – Jun 2026
Ifab 4 Next Generation Talents (Lavazza) — *Turin / Bologna, Italy*

- Designed BeanSight, a dashboard that aggregates public data sources to provide descriptive analytics supporting decision-making in the coffee supply chain, reaching the final stage of Ifab 4 Next Generation Talents.
- Led a multidisciplinary team of 6 students, communicating with technical and non-technical stakeholders, to deliver a product that removed the dependency on slow email- and spreadsheet-based processes.

Projects

GeoRust — *Rust, Tokio, WebSocket* — Source Code

- Developed an asynchronous client-server application in Rust (Tokio) for real-time client location tracking. Tested on consumer desktop hardware, where a single server handled 1,000 simultaneous client connections with a peak CPU usage of 2.5%.

EZShop — *Python, FastAPI, SQLite* — Source Code

- Developed a REST backend for a store sales and inventory management system, built following the Waterfall model. Achieved 96% test coverage with about 650 end-to-end, integration and unit tests.

Preventive Maintenance Tracker — *Python, FastAPI, PostgreSQL, Streamlit* — *Private Repository*

- Designed and implemented a maintenance management platform for the support team of electric vehicle charging stations, with scheduling of interventions and tracking of completed work.
- Independently deployed and managed the production infrastructure: containerized services hosted on a Hetzner VPS, with TLS encryption provided by Cloudflare and Certbot; received positive feedback from employees, although not yet formally adopted.
